

Duct Shaper

For Microducts ID 2-10 mm

Features

- Makes oval microduct cuts round in seconds
- Minimizes installation stops in connector interfaces
- For microducts ID 2-10 mm

Application

The tool is used to make the duct end perfectly round before mounting of microduct connectors.

A round microduct end will minimize the risk of fibers or cables get stuck in the connector.

Cut your microduct with a microduct cutter, insert the tip of this tool into the end until it stops and twist it a couple of times to regain the shape of the duct again.
